Motivation

How the original CCD  
algorithm works?

Improvements of the  
original algorithm

The CCD tracker

Results of the  
Experiments

Summary and Future  
work

# Outline

- 1 Motivation
- 2 How the original CCD algorithm works?
- 3 Improvements of the original algorithm
- 4 The CCD tracker
- 5 Results of the Experiments
- 6 Summary and Future work

## Motivation

### Some challenging tasks in personal robotics

- Image segmentation
- Pose estimation
- Object recognition and tracking

### Model-base method

- require much information external to the image
- Curve-fitting: a crucial part of these problems

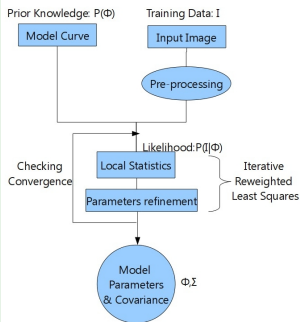

### Requirements

- Robustness: stable even in the presence of heavy texture, clutter, poor contrast, partial occlusion
- Accuracy: high sub-pixel accuracy
- Efficiency: time-constrained, limited computer hardware resources in personal robotics

## How the original CCD algorithm works?

### Flowchart of the CCD algorithm

**Figure:** the CCD algorithm

### Basic steps of the CCD algorithm

- 1 Contour initialization : initialize the model parameter vector  $\Phi$  (6-DOF or 8-DOF) and covariance matrix  $\Sigma_{\Phi}$

## How the original CCD algorithm works?

### Flowchart of the CCD algorithm

**Figure:** the CCD algorithm

### Basic steps of the CCD algorithm

- 1 Contour initialization : initialize the model parameter vector  $\Phi$  (6-DOF or 8-DOF) and covariance matrix  $\Sigma_{\Phi}$
- 2 Learning of local statistics : evaluate the likelihood; build the cost function

## How the original CCD algorithm works?

### Flowchart of the CCD algorithm

**Figure:** the CCD algorithm

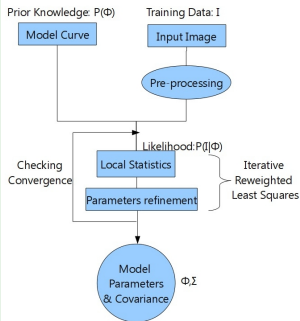

### Basic steps of the CCD algorithm

- 1 Contour initialization : initialize the model parameter vector  $\Phi$  (6-DOF or 8-DOF) and covariance matrix  $\Sigma_{\Phi}$
- 2 Learning of local statistics : evaluate the likelihood; build the cost function
- 3 Refinement of model parameters : Maximize the cost function using optimization algorithms

## How the original CCD algorithm works?

### Flowchart of the CCD algorithm

**Figure:** the CCD algorithm

### Basic steps of the CCD algorithm

- 1 Contour initialization : initialize the model parameter vector  $\Phi$  (6-DOF or 8-DOF) and covariance matrix  $\Sigma_{\Phi}$
- 2 Learning of local statistics : evaluate the likelihood; build the cost function
- 3 Refinement of model parameters : Maximize the cost function using optimization algorithms
- 4 Check for convergence, if not, go to Step 2

# An alternative view of the CCD algorithm

## A classification problem

**Figure:** A classification problem [1]

## An alternative view of the CCD algorithm

### Probit regression

- Evaluation of conditional distribution  $p(\Phi|\mathbf{I})$

$$p(\Phi|\mathbf{I}) \propto \underbrace{p(\mathbf{I}|\mathbf{m}_\Phi, \Sigma_\Phi)}_{\text{local statistics}} \times \underbrace{p(\Phi)}_{\text{prior distribution}}$$

Local statistics (likelihood): a probit function with respect to  $\Phi$

- Goal: MAP (maximum a posteriori probability) solution of cost function  $\mathcal{Q}(\Phi)$

$$\mathcal{Q}(\Phi) = \arg \max_{\Phi} \ln(p(\Phi|\mathbf{I}))$$

Approach: iterative reweighted least squares (IRLS) e.g. Gaussian Newton method, Gradient decent and SVM Least Squares.

- Summary and Future work

# Quadratic and Cubic B-spline curves

## B-spline curves

$$\mathbf{C}(u) = \sum_{i=0}^{m-n-2} P_i B_{i,n}(u) , u \in [u_n, u_{m-n-1}]$$

**Figure:** B-spline curves of degree = 1, 2, 3

# Contracting Curve Density (CCD) Tracker

---

## Algorithm 1 Contracting Curve Density (CCD) tracker

---

```
1:  $\Phi \leftarrow 0$ 
2:  $\mathbf{C} \leftarrow \text{contour\_initialization}()$ 
3: while NewFrame do
4:    $\mathbf{I} \leftarrow \text{pre\_processing}()$ 
5:    $\mathbf{C} \leftarrow \text{contour\_distortion}(\Phi)$ 
6:    $\Sigma \leftarrow \text{covariance\_initialization}()$ 
7:    $\Phi \leftarrow \Phi^{\text{old}}$ 
8:   while convergence = FALSE do
9:     local_statistics_learning()
10:    cost_function_MAP()
11:   end while
12:    $\Phi \leftarrow \Phi_{\text{MAP}}$ 
13:    $\Sigma \leftarrow \Sigma_{\text{MAP}}$ 
14: end while
```

- Results of the Experiments**
- Summary and Future work

# Initialization from SIFT Features

## Tracking initialized from SIFT features

- Match SIFT keypoints between the template image and the test image
- Discard the false matching points using the RANSAC algorithm
- Compute the homography
- Transform the contour of the template image onto the test image
- Apply the CCD tracker to the video

# Summary

## Investigate and implement the CCD approach

- Based on the OpenCV
- A ROS package: provide a ROS node interface to the ccd class  
<http://www.ros.org/wiki/contracting-curve-density>
- Released under open source BSD license

## Improvements

- B-spline curve and three-dimensional affine shape-space
- Logistic regression
- Automated contour initialization methods: SIFT features and point clouds

## Future work

### Future work

- Use statistics based on other image features instead of the RGB statistics
- Integration of the CCD algorithm into a more complex tracking framework (e.g. the Lucas-Kanade method (LKM), the extended Kalman filter (EKF))
- B-spline can not precisely represent many useful simple curves such as circles and ellipses, thus, Non-uniform rational B-spline (NURBS) is required for the CCD algorithm.
- Port to Android system to support mobile applications
- . . . .
